

Report

I started this project with the little HTML knowledge I had from previous classes with the basic frame part of the webpage after that I started working on Zybooks and project 1 at the same time which helped me to incorporate my new knowledge into my webpage. I watched all the videos our professor made on Cyberduck and project 1 before starting to work on the data transfer part of the assignment, after the email was sent with the username and password I did some test uploading some basic files to check if it was working correctly with no success but after some tries, it worked.

After this big step was accomplished I kept working on my project 1 adding more tags and some basic CSS attributes like Professor Marques explained in a video he recorded I learned more about HTML from Zybooks so my webpage was getting better and closer to what the Professor and TA's expect to see as project 1 with the minimum requirements to get full points on the assignment. I spent more time working on little details like the size of an image

Finally, after fixing and testing my webpage was ready to be uploaded it into the server, I add some interesting things like a favicon which I had never heard before or knew about its existence I have to admit that this little image took me a long time to make it work on my webpage. I tested my project 1 on different browsers like Microsoft Edge, Firefox, and Google Chrome I also sent my link to some friends and family members to make sure my webpage was working correctly.

I enjoy this project because it gave me the opportunity of looking at my mistakes and made the proper corrections it also helped me to improve my previous skills on HTML and learn new aspects of CSS, Cyberduck and the server part was something I had never used before it was very interesting to know more about how websites work.
